

Rockliffe MailSite 3.4 Internet E-mail Server Software For Windows NT Now Includes Total Web Management

Manage e-mail systems remotely from anywhere in the world

San Jose, Calif. - July 12, 1999 - Rockliffe Systems, Inc., a leading developer of scalable Internet e-mail server software for Windows NT, today announced that its popular Rockliffe MailSite now delivers full web-based and privilege-based management.

With complete web management, administrators can manage all domains, all mailboxes and all mail lists from any web browser. This important feature allows the administrator to manage the mail system remotely from anywhere in the world.

Rockliffe MailSite's privilege-based management features provide four "privilege levels" which administrators may delegate to other administrators, such as domain administrators, mail list moderators or users. These privilege levels include mailbox management, mail list management, domain management, and server management.

Full web-based management and privilege-based administration features are essential for businesses and organizations that outsource their e-mail services to Internet Service Providers (ISPs) or Application Service Providers (ASPs).

"Rockliffe MailSite provides the high levels of performance and reliability that companies are looking for when they outsource ISP hosting and application services.," said Nina Burns, CEO of Creative Networks, Inc., an e-business consulting firm based in Palo Alto, CA.

"With complete web management and privilege-based administration added to its trademark scalability and reliability, Rockliffe MailSite 3.4 is the best messaging system for corporations, ISPs and ASPs," said John Davies, president and CEO of Rockliffe. "Rockliffe MailSite gives ISPs and ASPs the freedom and the power to truly manage their customers' e-mail systems".

Rockliffe MailSite's reliability and performance attracted Digex, Inc., which hosts and manages large web sites for corporations such as Bayer, Nike, and Martha Stewart Online. Digex, which promises 99.7% uptime service levels to its customers, tested Rockliffe MailSite exhaustively and found it fully capable of processing the very high volumes of e-mail traffic.

"Increasingly, modern businesses are asking Digex to host reliable e-mail services to effectively communicate with customers and suppliers," said Bobby Patrick, Vice President, of Marketing of Digex. "Rockliffe delivers the level of reliability, training and support responsiveness that our customers demand."

Web management and privilege-based administration are crucial features for corporations that manage e-mail systems internally. With web management, corporate network administrators can manage all aspects of the system from anywhere – office, home, or remote location – wherever a browser is available. Rockliffe MailSite's new privilege levels allow administrators to reduce workload by delegating various e-mail management functions to other administrators within the organization.

Rockliffe MailSite is the only scalable, high-performance messaging system designed specifically to handle heavy, enterprise-level messaging traffic with no need for custom performance tuning. Rockliffe MailSite consistently delivers very high uptime and service levels.

Other important features of Rockliffe MailSite 3.4 include:

Full LDAP3 Support

- Publish a corporate white pages directory

Complete Systems and Web Management

- Windows, Web and Java management consoles
- Administration from any web browser
- Privilege-based administration
- Command line and batch administration tools
- Extensibility with Server Agents and New APIs

Unprecedented anti-SPAM support
