ROCKLIFFE'S SCALABLE E-MAIL SOFTWARE FOR WINDOWS NT AND 2000 PROVIDES LOW COST, RELIABLE ALTERNATIVE TO UNIX

New MailSite 4 DataCenter scales up to 1 million users per server and offers directory service integration and server clustering, plus MailSite Express, a brandable web-based e-mail client

San Jose, Ca, December 6, 1999-----Rockliffe, a leading developer of scalable Internet e-mail server software for Windows NT, today announced MailSite 4 DataCenter for high volume mission critical e-mail service providers.

Rockliffe MailSite DataCenter, using Windows NT and Windows 2000, delivers a level of vertical scalability not previously available in email server software. This capability is made possible by DataCenter's close integration of its directory service with Microsoft SQL Server. Rockliffe has developed this feature in response to overwhelming demand from internet customers that wish to integrate membership databases and database driven web sites with e-mail services.

"We have been testing the new MailSite 4 DataCenter from Rockliffe to deliver unified messaging services to over 750,000 subscribers. It has remained rock solid throughout the testing process" said Robert Newman, Founder of CoolEmail.com, formally Planetary Motion, Inc. " We are impressed with the ease of use and cost efficiency, especially when compared to the UNIX alternatives" Newman added.

Rockliffe MailSite DataCenter also features horizontal scalability while maintaining proven reliability with its new clustering capability. MailSite clustering now enables customers to distribute e-mail load from users over two or more machines. This allows customers to support one million subscribers or more on each server while maintaining maximum up-time. MailSite clustering works with any version of Windows NT and Windows 2000, and does not depend on Microsoft's clustering implementation.

MailSite Express, the web-based e-mail client that is included with MailSite 4 DataCenter, will allow Rockliffe's internet customers to retain their users at no extra cost. Building on the standard set by Microsoft Hotmail (tm) and Yahoo Mail (tm), MailSite Express will make users 'stick' to that ISP rather than surfing between a choice of several. MailSite Express will allow anyone to set up their own "Hotmail-like" service with ease. MailSite Express is built using Active Server Pages which make it easy to brand and customize.

Rockliffe MailSite 4 DataCenter will be available in February 2000 from Rockliffe and prices start at one dollar per user.

The MailSite 4 product family also offers MailSite 4 Enterprise for up to 100,000 users, MailSite 4 Department for up to 1000 users, and MailSite 4 Workgroup for up to 100 users. MailSite Express is bundled at no additional cost with each of these products.
