

MailSite[®] Sync Server 10

MailSite Sync Server is an Exchange ActiveSync compatible server that synchronizes email, calendars and contacts with Outlook 2013.

MailSite Sync Server also works with iPhone, iPad, BlackBerry, Android, Windows and Nokia smartphones

WHAT IS IT?

MailSite Sync Server is an Exchange ActiveSync compatible server that can synchronize email, calendars and contacts with Outlook 2013. MailSite Sync Server can also push email, calendars and contacts over-the air to iPhone, iPad, BlackBerry, Android, Windows and Nokia smartphones. MailSite Sync Server is a component of MailSite Fusion 10 that can be licensed on a per-mailbox, per-domain or per-server basis.

HOW IS IT DIFFERENT FROM EXCHANGE?

MailSite Sync Server is functionally very similar to the ActiveSync server in Microsoft Exchange. ActiveSync smartphones connecting over-the-air cannot tell that they are not connecting to an Exchange ActiveSync server.

With the optional AstraSync client, MailSite Sync Server can support BlackBerry smartphones without requiring the BlackBerry Enterprise Server or BlackBerry Internet Service.

Smartphones connected to the MailSite Sync Server are fully integrated with the email, calendar and contact data store in MailSite Fusion 10. With the ExpressPro web client and the integration with Outlook 2013, users have access to all of their email, calendar and contact data from every device – desktop computer, web browser and smartphone.

Further Information:

For further details on MailSite licensing including MailSite Sync Server please contact: sales@mailsite.com

WHAT'S NEW?

MailSite Sync Server is now **fully compatible with Microsoft Outlook 2013**. Users can connect to MailSite Sync Server using the Exchange ActiveSync account in Outlook 2013.
