

Email without the overhead

MailSite brings webmail, calendars, contacts, client synchronization and server administration together on infrastructure you control. Its own HTTP service serves webmail and synchronization without a separate IIS installation.

Welcome to MailSite 11

From: Alex Morgan <alex@lab.test>
To: Postmaster@lab.test
Date: 9/23/2026, 5:45:55 PM

Your team workspace is ready. ExpressPro brings mail, calendars and contacts together so everyone can find the information they need.

Start in the inbox. The message list shows recent conversations from colleagues across sales, support, operations and project teams. Select any message to read it here; search and filters help you find earlier discussions. You can compose, reply, forward, flag or organize a message from the toolbar above.

Open Contacts to browse the team directory. Each contact includes a name, email address, company, role and business phone number. Keeping those details together makes it easier to recognize people in your inbox and reach the right team.

The Calendar includes planning meetings, customer appointments, project milestones and team events. Switch between day, week and month views to see what is coming up. You can keep separate calendars for team work, projects and customer activity.

Administrators can open the MailSite Console to manage domains, mailboxes, mailing lists and service settings. The example Console screens show a populated lab environment created for this guide. They are safe sample records and do not represent a production customer.

Please take a few minutes to explore the workspace. Review the team planning message and the upcoming appointments, then open your contacts and calendars. If you need access to another mailbox or list, contact your administrator.

Regards,
Alex Morgan
Account Manager

ExpressPro mail and calendar workspace

One place to work

Use ExpressPro for mail, contacts and calendars in a browser.

Client choice

Connect compatible desktop and mobile applications through supported protocols.

One Console

Manage domains, mailboxes, security and service activity in one interface.

Built for your mail environment

Mail and collaboration

A redesigned ExpressPro provides mail, contacts, calendars, search and account settings in a single workspace.

Administration

The Console manages domains, mailboxes, mailing lists, certificates, services and logs. Delegate access at the appropriate scope.

Security and filtering

Configure TLS and domain certificates, native ClamAV scanning, Bayesian spam filtering and Sieve mail rules.

Hosting and growth

Operate multiple domains and plan clustered deployments with shared storage, load balancing and backup.

Client access

Browser	ExpressPro for mail, calendars and contacts
Classic Outlook	MAPI over HTTPS; verify the exact Outlook build and workflows
Compatible desktop clients	Exchange Web Services (EWS)
Mobile clients	Exchange ActiveSync through version 16.1
Standard mail clients	IMAP, POP and SMTP

Plan a reliable rollout

Test the client versions and workflows your organization uses, including meetings, sharing, contacts and offline access. Configure a trusted certificate and review the current release notes and upgrade guidance before moving production users. Back up both mailbox files and database-only state before upgrades that cross a reset boundary.

MailSite 11 is in beta. Product capabilities and deployment requirements can change; use the current release notes for version-specific details.
